

Book 4: Company and Execution Plan

Cynqra Company Book, v0.1. This book answers: who do we hire, what are the next 90 days, and what have we decided? Owner: CEO. This book holds the team plan, the execution plan, and the Decision Log that governs the whole canon.

1. Operating model and canon ownership
2. Day one team and hiring order
3. The first 90 days
4. Validation before the team: the Wizard of Oz run
5. Decision Log
6. Canon governance

1. Operating model and canon ownership

Role	Owns	Accountable for
CEO (founder)	Book 0, Book 4	Doctrine, objectives, budget, risk tolerance, final decisions
CPO	Book 1	MVP scope, journeys, metrics, acceptance criteria
CTO	Book 2	Architecture decisions, schemas, security, spike results
COO	Book 3	Incidents, liability posture, unit economics, compliance

Cadence: a weekly canon review, 30 minutes. One page per book: what changed, what we learned, what decisions we need. The Decision Log is updated live.

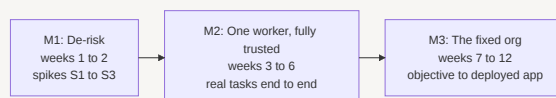

2. Day one team and hiring order

#	Role	Why this order	Trigger to hire
1	Founding engineer / CTO	Owns runtime, event core, architecture	Day 1
2	Agent and LLM engineer	Worker runtime, model registry, evaluation, protocols	Day 1
3	Product engineer (full stack)	Dashboards, approval inbox, objective wizard	Week 3 to 4, once the spikes land
4	Designer (fractional)	Decision dashboard, org graph UX	Week 6, before the first demo
5	COO / ops (fractional)	Cost model, legal posture, support	First paying company

The CEO is the product owner until a CPO exists. Nobody is hired to do what the canon has not defined.

3. The first 90 days

Phase	Weeks	Goal	Exit criteria
M1: De-risk	1 to 2	Run spikes S1 to S3 (Book 2 §9)	Three spike memos, cost model v0, go or no go on the architecture
M2: One worker, fully trusted	3 to 6	A single worker executes real tasks end to end: sandbox, tools, audit trail, verification, budget breaker	Live demo: assign task → worker executes → verified output → complete audit replay
M3: The fixed org	7 to 12	The fixed 4 worker template (CTO, PM, 2 engineers) runs protocols, escalations and approvals, and ships one real constrained product	Live demo: objective in → deployed web app out, founder approving only HIGH risk decisions, export bundle delivered

The 90 day definition of done: the Book 1 demo sentence is true, on video, with the event log to prove it.

4. Validation before the team: the Wizard of Oz run

Before any hire (or in parallel with hiring), we run one real project through a manual Cynqra. The CEO plays orchestrator, off the shelf AI tools play the workers, and the run follows the canon's own rules.

- **Follow** the protocol contracts (Book 2 §7), the escalation rules (Book 0 §11) and the verification tiers (Book 0 §13).
- **Log** events per the catalog (Book 2 §6). A spreadsheet is fine.
- **Measure** founder interventions, token and time cost, and verification catch rate.
- **Output:** a run report appended to this book. Every place the loop breaks becomes an engineering requirement. This is the cheapest validation we will ever get.

5. Decision Log

The single record of consequential decisions. Newest last. Never delete, only supersede.

ID	Date	Decision	Status	Owner
D-1	2026-08-16	The PRD becomes a canon: Book 0 (doctrine) plus Books 1 to 4 (execution). "Final PRD v1.0" is archived as the historical draft	● Decided	CEO
D-2	2026-08-16	The MVP is a fixed org template delivering a deployed web app. No dynamic org synthesis	● Decided	CPO
D-3	2026-08-16	Human workers deferred past Phase 2 (Book 3 §5)	● Decided	CEO
D-4	2026-08-16	Verification is the make or break system. It gets a dedicated spike (S3) and a tiered design	● Decided	CTO

ID	Date	Decision	Status	Owner
D-5	2026-08-16	Progressive autonomy ladder L0 to L3. New companies start at L1	 Decided	CPO
D-6	2026-08-16	First product category for runs: CRUD style web apps, because they have the richest automated verification	 Proposed	CPO
D-7	2026-08-16	Open tension: cross company learning (Book 0 §30) vs founder data ownership (Book 0 §20). Current position: no cross tenant learning without explicit opt in (Book 3 §7). Needs a doctrine resolution before any learning feature ships	 Open	CEO
D-8	2026-08-16	Pricing model (per run vs subscription) deferred until the cost model has real data (Book 3 §6)	 Deferred	COO
D-9	2026-08-16	Name check: "Cynqra" reads close to "cynic". Run a 10 person gut check before any brand investment	 Proposed	CEO
D-10	2026-08-16	Every founder inbox action is captured as a decision label. The Decision entity gains what_would_change_this and label fields (bench: Wang, Amodei)	 Decided	CTO
D-11	2026-08-16	The entry point is doctrine: we own the moment an objective is	 Decided	CPO

ID	Date	Decision	Status	Owner
		born (wizard first), and the founder surface is capped at roughly 3 decisions a day at any org size (bench: Altman, Huang)		
D-12	2026-08-16	Regulatory-first strategy adopted: Books 2 and 3 go to standards bodies this year as a reference architecture for auditable AI organizations (bench: Suleyman)	● Decided	COO
D-13	2026-08-16	Eval corpus cold start: golden sets hand built from Wizard of Oz runs, conservative thresholds, L1 default until labels accumulate (bench round 3: Wang)	● Decided	CTO
D-14	2026-08-16	Labels are weighed against outcomes, never treated as truth. The falsification field on every recommendation is written by an independent reviewer model, not the recommending pipeline (bench round 3: Huang, Amodei)	● Decided	CTO
D-15	2026-08-16	Public accountability standard: 72 hour disclosure for public-harm incidents, insurance sized to the worst plausible run (bench round 3: Suleyman)	● Decided	COO

ID	Date	Decision	Status	Owner
D-16	2026-08-16	The founder relationship is a standing appointment, not a management console: daily three decisions plus a weekly evolution review (bench round 3: Altman)	 Decided	CPO

6. Canon governance

1. Book 0 changes only by founder decision logged here.
2. Books 1 to 4 change freely within their owner's authority. Every change is versioned and dated in the book's footer.
3. Contradictions between books are bugs. Fix the book, or log the decision that changes it.
4. The canon test: if a team member asks a question the canon cannot answer, that is a canon gap. Log it, answer it, write it down.

Version history: v0.3. Decision Log extended (D-13 to D-16) from bench round 3. v0.2: D-10 to D-12. v0.1: first draft, decision log seeded from the doctrine review.

Book 4: Company & Execution — Production Build Addendum v0.4

Book 4 remains the decision and execution source of truth.

Purpose: make the Canon's decision states explicit and provide production execution gates. Genuine founder/counsel decisions remain open rather than being invented.

Canonical status rule

Book 4 remains the only place where cross-book consequential decisions are ratified. A recommendation, proposed ADR, or hardening proposal is not a decision until the Decision Log says so.

Status	Meaning	Engineering behavior
Decided	Approved and binding	Implement/operate accordingly.
Proposed	Recommended but not ratified	May be evaluated/spiked; must not be treated as product or governance truth.
Open	Requires founder/counsel decision	Do not silently resolve; isolate behind a safe default if the existing Canon permits one.
Deferred	Intentionally postponed	Do not implement unless a trigger is reached.

Decision Log additions required for final production build

ID	Decision	Status	Owner
D-17	Resolve the Book 0 MEDIUM-risk manager-review rule versus Book 1 L2 wording; Book 0 remains authoritative until resolved.	Open	CEO
D-18	Adopt the canonical implementation event envelope/catalog in Book 2.	Proposed	CTO
D-19	Adopt the MVP entity schema contract in Book 2; defer non-MVP conceptual entities until required.	Proposed	CTO
D-20	Make Action and Verification first-class MVP records.	Proposed	CTO
D-21	Explicitly ratify the existing production-deployment human approval boundary for MVP.	Proposed	CEO + CTO
D-22	Resolve immutable-event deletion/retention treatment before first paying customer.	Open	CEO + COO + Counsel
D-23	Adopt capability/action/environment/risk-scoped autonomy promotion and safety demotion rules.	Proposed	CEO + CTO
D-24	Adopt the deployment lifecycle and deployment record in Book 2.	Proposed	CTO
D-25	Adopt the export manifest and portability-status contract.	Proposed	CTO + COO
D-26	Add a weekly Canon CI consistency review covering terminology, scope, events, schemas, authority and decision status.	Proposed	CEO

These entries are deliberately not marked decided by this addendum. The source Canon gives Book 4 the authority to ratify them. Until then, the existing source text and the Canon hierarchy govern.

90-day execution gates

Gate	Timing	Required exit evidence
G0 Canon ready	Before build	No unresolved P0 contradiction; current source decisions mapped; open decisions explicitly isolated.
G1 Runtime safe	Weeks 1–2	Sandbox, Tool Gateway, policy enforcement, secrets isolation, budget breaker, kill switch and audit demonstrated.

Gate	Timing	Required exit evidence
G2 Verification trusted	Weeks 1–6	S3 target met; completed vs verified separated; rework and defect escape measured.
G3 One worker	Weeks 3–6	Real task end-to-end with replay, verification, budget control and unauthorized-action denial.
G4 Fixed org	Weeks 7–12	CTO + PM + 2 engineers execute the existing fixed template and resolve at least one dependency without founder involvement.
G5 Pilot readiness	Before customer	Deployment, rollback, export, deletion/retention posture, support, incident response and counsel-required positions are ready.

Canon CI

The weekly canon review must check: terminology, entity names, event names, risk tiers, autonomy levels, protocol names, MVP/non-goal boundaries, ownership, decision status, references and acceptance criteria. A contradiction is a Canon bug and must be fixed or explicitly decided.

Final founder decision boundary

The team may choose implementation details that satisfy the Canon. The team may not silently choose product behavior, authority boundaries, governance policy, customer data rights, cross-tenant learning policy, or other founder-level decisions that the Canon leaves open.
